                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to methods of distinguishing malignant or growth arrested malignant cells from proliferating non-malignant cells by staining specifically Nuclear Mitotic Apparatus (NUMA) protein in a sample of intact mammalian cells and imaging the cells to determine the three-dimensional pattern of labeled NUMA protein within nucleic of the cells. The method is useful for distinguishing malignant or growth arrested malignant cells from proliferating non-malignant cells. Lumors cells and different stages in the tumor progression and different stages in the tumor progression and differentiation processes. NUMA proteins may be used to identify functional proteins or drugs to specific locations inside the cells. The present sequence represents the human NUMA protein (GenBank Accession
                                                                                                                                                                                                                                                                                   NuMA; Nuclear Mitotic Apparatus protein; malignant; cell growth; human;
tumor progression; structural protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Distinguishing growth arrested malignant cells from proliferating non-malignant cells, comprises staining the nuclear mitotic apparatus protein in intact mammalian cells and determining the 3-dimensional pattern of the labeled protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         --LHYSNALQEKELAASRCRSLQEELYL----- 103

                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying at therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. They may be used to increase stem cell proliferation, to regulate haematopolesis; and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukaemias. AAUS510-AAU3304 represent the amino acid in treatment of leukaemias. AAUS510-AAU3304 represent the amino acid

The sequences given in AAW21731-32 represent fusion proteins which contain NuMA (nuclear mitotic apparatus). The fusion proteins were used in the identification of NuMA interacting proteins (NIE's) (see also AAW21729-30). Compounds which interfere with the interaction of NuMA proliferation. Ab. raised conventionally using NIP-1 or -2 as immunogen, are used to detect NIP (or their complexes) and to block their activity for diagnostic or therapeutic use, e.g. to detect defective NuMA or NIP which may be markers for aberrant (including malignant) cell growth (which can also be detected by nucleic acid sequencing). Also where malignancy is related to defects in NUMA or NIP, it can be treated by administration of the appropriate functional protein.
proteins - useful for modulating cell division and proliferation and

A.Description: Examination of the gene encoding rabbit trichohyalin.
A.Reference number: 528589
A.Molecule type: DNA
A.Molecule type: DNA
A.Molecule type: DNA
A.Residues: 1-1407 <FIES
A.Molecule type: DNA
A.Residues: Trichohyalin is a protein of the medulla of the hair and of the inner root C.Comment: Trichohyalin is a protein include conversion of arginine to citrulline a C.Genetics: 46/3
C.Genetics: 46/3
C.Superfamily: trichohyalin; calmodulin repeat homology
C.Keywords: calcium binding; citrulline; EF hand; hair; tandem repeat
F.49-81/Domain: calmodulin repeat homology <EF2>

TISSUE SPECIFICITY: Detected in adult peripheral blood leukocytes, thymus, spleen and liver. Also found in promyelocytic leukemia HL-hymus, spleen and liver. Also found in promyelocytic leukemia HL-hymboma Raji cells and colorectal adenocarcinoma SW480 cells. Unphoma Raji cells and colorectal adenocarcinoma SW480 cells. Not detected in HeLa S3, Wolt-4, A549 and G431 cells. Burkitt's SIMILARITY: CONTAINS I CARD DOMAIN.
SIMILARITY: CONTAINS I PDZ/DHR DOMAIN.
SIMILARITY: CONTAINS I GUANYLATE KINASE-LIKE DOMAIN.
CAUTION: SUPPOSED to contain a SH3 domain which is not detected by PROSITE, Pfam or SMART.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  "FUNCTION: Activates NF. kappaB via Bcll0 and IKK.
-!- FUNCTION: Activates NF. kappaB via Bcll0 and IKK.
-!- SUBUNT: CARD10 and Bcll0 bind to each other by CARD-CARD
INTERACTION: They both participate in a complex with MALT1, where
MALT1 binds to Bcll0 (By similarity).
-!- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-!- TISSUB SPECTIFICITY: Detected in adult heart, kidney and liver;
-!- Inver levels in intestine, placenta, muscle and lung. Also found
in fetal lung, liver and kidney.
-!- SIMILARITY: CONTAINS 1 CARD DOWAIN.
-!- CAUTION: Supposed to contain a SH3, a PDZ and a guanylate kinase-
-!- Like domain. But none of these 3 domains are detected by PROSITE,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CAUTION: Ref.4 sequence differs from that shown due to various gene identification problems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Length 1032;

Caspase recruitment domain protein 10 (Bcl10-interacting MAGUK protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Bcllb-mediated NF-kappa B induction.";
J. Biol. Chem. 276:30589-30597(2001).
--- FUNCTION: Activates NF-kappaB via Bcll0 and IKK.
--- SUBGUNIT: CARDIO and Bcll0 bind to each other by CARD-CARD interaction. They both participate in a complex with MALT1, where MALT1 binds to Bcll0.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      -:- TISSUE SPECIFICITY: Highly expressed in kidney, heart followed by brain, lung, liver, skeletal muscle and testis.
-:- SIMILARITY: CONTAINS I CARD DOMAIN.
-:- CAUTION: Supposed to contain a SH3, a PDZ and a guanylate kinase-

FUNCTION: Activates NF-kappaB via Bcl10.
SUBUNIT: Self-associates. CARD9 and Bcl10 bind to each other by CARD-CARD interaction: Cytoplasmic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              230 HTLKLRHAMEORPSOELLWDLOOERDLLQARVOELEVSVOEGKLHRNSPYIQVLEEDWRO

-:- FUNCTION: INTERMEDIATE FILAMENT ASSOCIATED PROTEIN THAT ASSOCIATES IN REGULAR ARRAYS WITH KERATIN INTERMEDIATE FILAMENTS (KIF) OF THE INNER ROOT SHEATH CELLS OF THE HAIR FOLLICLE AND THE GANULAR LAYER OF THE EPIDERMIS. IT LATER BECOMES CROSS-LINKED TO KIF BY ISODIPEPTIDE BONDS. IT MAY SERVE AS SCAFFOLD PROTEIN, TOGETHER WITH INVOLUCRIN, IN THE ORGANIZATION OF THE CELL ENVELOPE OR EVEN ANCHOR THE CELL ENVELOPE TO THE KIF NETWORK. IT MAY BE INVOLUED IN
                                                                                                                                                                                                                                                                                                                                                                                    -i-TISSUE SPECIFICITY: FOUND IN THE HARD KERATINIZING TISSUES SUCH AS THE INNER ROOT SHEATH (IRS) OF HAIR FOLLICLES AND MEDULLA, AND IN THE FILIFORM PATILLAE OF DORSAL TONGUE EPITHELIUM (PROBABLE).
                                                                                                                                                                                                                                                                  ITS OWN CALCIUM-DEPENDENT POSTSYNTHETIC PROCESSING DURING TERMINAL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CALCIUM-BINDING DOMAINS. DOMAIN I CONTAINS TWO EF-HAND CALCIUW-BINDING DOMAINS. DOMAINS 2-4, 6, AND 8 ARE ALMOST ENTIRELY ALPHA-HELICAL, CONFIGURED AS A SERRES OF PEPTIDE REDEATS OF VARYING REGULARITY. AND ARE THOUGHT TO FORM A SINGLE-STRANDED ALPHA-HELICAL ROD STABILIZED BY IONIC INTERACTIONS. DOMAIN 6 IS DOMAINS 5 AND 7 ARE LESS WELL ORGANIZED BY IONIC INTERACTIONS. THE MOST REGULAR AND MAY BIND KIF DIRECTLY BY IONIC INTERACTIONS. THE MOLECULE. DOMAIN 9 CONTAINS IN THE MOLECULE. DOMAIN 9 CONTAINS IN THE MOLECULE. DOMAIN 9 CONTAINS IN THE WOLECULE. DOMAIN 9 CONTAINS IN THE WOLECULE. DOMAIN 9 CONTAINS IN THE WOLECULE.

"Characterization of the kinetochore binding domain of CENP-E reveals interactions with the kinetochore proteins CENP-F and hBUBRI.";

J. Cell Biol. 143:49-63(1998).

- FUNCTION: MINUS-END DIRECTED MICROTUBBLE MOTOR. PROBABLE KINETOCHORE MOTOR. ACCUMULATES JUST BEFORE MITOSIS AT THE G2 PHASE OF THE CELL CYCLE. PROBABLY IMPORTANT FOR CHROMOSOME MOVEMENT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SUBGNIT: INTERACTS WITH CENP-F AND BUBRI KINASE.
SUBCELLULAR LOCATION: ASSOCIATES WITH KINETOCHORES DURING
CONGRESSION, RELOCATES TO THE SPINDLE MIDSONE AT ANAPHASE, AND IS
QUANTITATIVELY DISCARDED THE NED OF THE CELL DIVISION.
SIMILARITY: BELONGS TO THE KINESIN-LIKE PROTEIN FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CAPPING.

- CAPPING.

- SUBUNIT: MYOSIN IS A HEXAMERIC PROTEIN THAT CONSISTS OF 2 HEAVY
CHAIN SUBUNITS (WHC), 2 ALKALI LIGHT CHAIN SUBUNITS (MLC) AND 2
REGULATORY LIGHT CHAIN SUBUNITS (MLC-2).

- DOMAIN: THE RODLIKE TAIL SEQUENCE IS HIGHLY REPETITIVE, SHOWING
CYCLES OF A 28-RESIDUE REPEAT PATTERN COMPOSED OF 4 HEPTAPEPTIDES,
CHARACTERISTIC FOR ALPHA-HELICAL COLLED COILS.
- SIMILARITY: CONTAINS 1 MYOSIN-LIKE GLOBULAR HEAD DOMAIN.
- SIMILARITY: CONTAINS 1 1Q DOMAIN.

MADLIGATION OF PLECTIN AS A SUBSTRATE OF P34CdC2 kinase and applied of a single phosphorylation site.";

J. BIOL. CHEM. 271:8203-8208(1996).

C. I- FUNCTION: INTERLINES INTERMEDIATE FILAMENTS WITH MICROTUBULES AND MICROFILAMENTS AND ANCHORS INTERMEDIATE FILAMENTS TO DESMOSOMES OR HEMIDEANGOMES. MAY BE INVOLVED NOT ONLY IN THE CROSSLINKING AND STABLILIZATION OF CYTOSKELETAL INTERMEDIATE FILAMENTS NETWORK, BUT STABLILIZATION OF THEIR DYNAMICS.

C. I- SUBDINT: HOMODIMER OR HOMOTETRAMER.

C. I- DOMAIN: THE N-TERMINUS CAN BIND INTEGRIN BETA-4.

C. I- DOMAIN: THE N-TERMINUS CAN BIND INTEGRIN BETA-4.

C. I- PIM: PHOSPHORYLATED BY CDC2: REGULATES DISSOCIATION FROM INTERMEDIATE FILAMENTS DURING MITOSIS.

C. I- SIMILARITY: CONTAINS 1 ACTIN-BINDING DOMAIN.

C. I- SIMILARITY: CONTAINS 32 PLECTIN REPEATS.

C. I- SIMILARITY: CONTAINS 32 PLECTIN REPEATS.

C. I- SIMILARITY: CONTAINS 32 PLECTIN REPEATS.

C. I- SIMILARITY: CONTAINS 4 SPECTRIN REPEATS.

```
The precting gene causes epidermolysis bullosa simplex with precting the causes because sepidermolysis bullosa simplex with precting and J. Pathol. 158:617-625(2001).

C. -! FUNCTION: INTERLINKS INTERMEDIATE FILAMENTS TO DESMOSOMES OR HEMIDESMOSOMES. COULD ALSO BIND MUSCLE PROTEINS SUCH AS ACTIN TO CC. HEMIDESMOSOMES. COULD ALSO BIND MUSCLE PROTEINS SUCH AS ACTIN TO MEMBRARE COMPLEXES IN MUSCLE. MAY BE INVOLVED NOT ONLY IN THE CC. -! SUBUNT: HOMODIMER OR HOMOTETRAMER.

C. -! ALTERNATIVE PRODUCTS: 3 ISOFOMAS; 1 (SHOWN HERE), 2 AND 3; ARE PRODUCED BY ALTERNATIVE SPLICING; 1 (SHOWN HERE), 2 AND 3; ARE CC. -! ALTERNATIVE PRODUCTS: 3 ISOFOMAS; 1 (SHOWN HERE), 2 AND 3; ARE CC. -! ALTERNATIVE PRODUCTS: 3 ISOFOMAS; 1 (SHOWN HERE), 2 AND 3; ARE CC. -! ALTERNATIVE PRODUCTS: 3 ISOFOMAS; 1 (SHOWN HERE), 2 AND 3; ARE CC. -! ALTERNATIVE PRODUCTS: 3 ISOFOMAS; 1 (SHOWN HERE), 2 AND 3; ARE CC. -! DOMAIN: THE N-TERMING INTERACTS WITH ACTIN, THE C-TERMINUS MITH CC. -! DOMAIN: THE N-TERMINUS INTERACTS WITH ACTIN, THE N-TERMINUS INTERACTS WITH ACTIN, THE N-TERMINUS CC. -! DOMAIN: THE N-TERMINUS CAN BIND INTERSITUS, LAMIN B; WHEREAS BOTH THE N-TERMINUS CAN BIND INTERSITUS, ENTERSATION FROM WITH MUSCULAR DYSTROPHY (MD-EBS OR EB-MD), AN AUTOSOMAL RECESSIVE CC. -! DISEASE: DEFECTS IN PLECI ARE THE CAUSE OF EPIDERMOLYSIS BULLOSA WITH MUSCULAR DYSTROPHY (MD-EBS OR EB-MD), AN AUTOSOMAL RECESSIVE CC. -! SIMILARITY: CONTAINS 3 PLECTRIN REPEATS.

C. -! SIMILARITY: CONTAINS 3 PLECTRIN REPEATS.

C. -! SIMILARITY: CONTAINS 4 SPECTRIN REPEATS.

C. -! SIMILARITY: CONTAINS 4 SPECTRIN REPEATS.
